Governance

Ownership, contracts, and an audit trail that make a project trustworthy

Ownership An owner arbitrates and chases a fix, not fixes it personally

```
config:
  meta:
    owner: finance-team
```

```
Resolves to PagerDuty/Opsgenie
Survives a departure
```

Model contracts A breaking change fails the build, not a dashboard

```
config: {contract: {enforced: true}}
columns:
  - name: order_id
    data_type: text
  - name: order_total
    data_type: numeric
```

`Build fails on mismatch`	Not a silent schema drift

dbt artifacts Every run's own record, worth ingesting, not overwriting

`manifest.json`	Full project graph
`run_results.json`	What ran, pass/fail, timing
`catalog.json`	Metadata + freshness
`dbt_artifacts package`	Ingests them into the warehouse

Audit logging Who touched what and when, agent sessions included

`Warehouse query history`	Who ran what, when
`dbt run logs`	What changed, by whom
`Access-grant history`	Often shipped to a SIEM
`Agent sessions count too`	Not just people

Project clean-up The same info_schema pattern, aimed at orphaned models

```
select m.unique_id
from {{ info_schema('models') }} as m
left join {{ info_schema('edges') }} as e
  on e.parent_unique_id = m.unique_id
where e.child_unique_id is null
```

```
dbt ls --select "models/marts/+"
Sanity-check refs
```

Model certification A claim worth nothing until a check verifies the bar

```
select m.unique_id
from {{ info_schema('models') }} as m
where (m.meta ->> 'certified') = 'true'
  and m.contract_enforced = false
```

```
Owner + tests + contract + docs
The bar it checks
```

dbt Mesh The real adoption trigger is org structure, not model count

```
models:
  finance:
    +group: finance
```

```
access: private/protected/public
Pick one explicitly

Enterprise: cross-project ref()
dbt-loom: OSS equivalent

~10:1 ratio
Warrants an enterprise mesh

~5:1 ratio
Fits hub-and-spoke instead
```
